DOCKER SANDBOXES

A smaller internet for your agent

Pradumna Saraf

On my laptop, the agent can reach any host

npm

github.com

the model API

a link in a README

an address in a config file

any host on the internet

Three of those I chose. Three I did not.

Text the agent reads can tell it where to go next. That is prompt injection, and the download it asks for looks like ordinary work.

In a sandbox, I make the default no

```
$ sbx policy check network --sandbox demo <host>

api.anthropic.com              Allowed
registry.npmjs.org             Denied
github.com                     Denied
cdn-config.pradumnasaraf.dev   Denied
```

I start the agent in a box where the network is shut.

I pick deny-all at setup. Docker opens the few hosts the agent needs to think. I add the rest, one at a time.

Let me show you

> switch to terminal

What you just saw

01 It asked for npm. It did not get npm.

02 I opened npm. Nothing else opened.

Two things I would change

01

A blocked connection doesn't look blocked

The docs say SSH is blocked. It connects, then goes quiet. The program sees the far end hang up, named by IP. Web traffic gets a real 403 that says why. Refuse the connection instead.

02

Allowing one host opens it for every sandbox

The rule lands with scope: global. There is a --sandbox flag, but the default points the wrong way.
